PROJECT: **IAM CORE**

USER GUIDE

API Settings

This document is a user guide and contains information of accessible public classes for the Iam-core application. The below doc includes an API (application programming interface) that gives software developers the opportunity to view, extend and exhibit classes that are visible and usable outside the Iam core applications.

Enabling the API

By default, the API is readily available publicly and so developers will not need to enable this anywhere within their dashboard.

- By default the API will be enabled, but in future, we intend to make this part configurable such that users can enable and disable at any time.

API Permissions

Permissions to modify any data are only given to existing users of Iam core application who are by default administrators of the application. .

A chart will be provided that will show only what is possible via the API. So, for example, it shows that it is possible to delete an identity via the API, if the user has sufficient permissions. However, even a super user interacting with the API will not be able to add or delete users without appropriate permissions to the api.

Chart of available API''s

1. **Add an identity**

When on an create identity section, you may add that item to the Identities, by passing the required parameters(username, email, uid).

2. **Delete Identity**
3. **Update Identity**

4. List all Identities
